

LED Worklight

Having worked underneath my benchwork with a old fashioned halogen worklight, it became obvious how dangerous that tool had really become. It, of course became very hot, and if not VERY careful, it could easily be touched and caused serious burns, not to mention the possibility of starting a fire.

Being a big fan of LED lighting, I looked to see if there were any LED lights capable of competing with the high lumen halogen lamp output.

There are and I purchased one that I would recommend to all of you.

It is from Snap-on, the tool company, the name of the product is 2000 Lumens LED Worklight and the model # is 871356U.

I purchased it from Amazon for \$62, pricey but well worth the piece of mind relating to a safe workplace.
